

Data Visualization Project: NYC Police Arrests

Law enforcement is a difficult task to maintain, especially during COVID-19 Pandemic Lockdowns in New York City. To shift changes, it would be best for the Mayor of New York to understand such concerns based on these questions:

1. Which boroughs have the highest concentrations of arrests?
2. What age group had the highest number of arrests?
3. What months saw an increase or decrease in crime?
4. What was the gender gap in arrests?

Through our analysis, these are our findings:

Arrests by Crime Category, Age Group, and Sex

Based on these findings we can determine for questions 2 and 4 is:

- On average, men are likely to commit all types of crime compared to women
- Both men and women are likely to commit violent crimes
- The age group that tend to commit crimes is between the ages of 25-44 years old

With these insights we can recommend:

- To fund, provide, and promote mental health programs especially after depressive symptoms from the COVID-19 Pandemic
- Provide federal programs that support job training and other basic needs especially for those that are at the ages of 25-44
- Expand mentorship and violence-prevention events/programs/initiatives for young men
